RBS (RANDOM BLOOD SUGAR)

<u>PARAMETER</u>	<u>METHOD</u>	<u>RESULT</u>	<u>UNIT</u>	<u>B.R.I</u>
Random Blood Sugar	Hexokinase	81	mg/dl	Normal: 60 - 150 Impaired: 151 - 199 Diabetes: > 199

Comments/Interpretation:

- A random blood sugar test checks your blood glucose at a random time of day.
- The results are released as they warrant immediate medical attention.

SERUM CREATININE

PARAMETER	METHOD	RESULT	UNIT	B.R.I
Serum Creatinine	Jaffe Kinetic IDMS	0.8	mg/dl	Adult 0.6 - 1.5 New Born 0.3 - 1.0 Children 0.2 - 0.4

- * Useful in the diagnosis of renal insufficiency and is a more specific and sensitive indicator of renal disease than of BUN.
- * The use of simultaneously BUN and creatinine levels provides more information in the diagnosis of renal insufficiency.
- Measurements of Creatinine are used in the diagnosis and treatment of renal disease and prove useful in the evaluation of kidney glomerular function and in monitoring renal dialysis.

SERUM ELECTROLYTES (NA+,K+,CL-)

<u>PARAMETER</u>	<u>METHOD</u>	<u>RESULT</u>	<u>UNIT</u>	<u>B.R.I</u>
Sodium (Na+)	ISE Indirect	143	mmol/L	136 - 145
Potassium (K+) - Serum	ISE indirect	4.5	mmol/L	3.5 - 5.0
Chloride (Cl-)	ISE Indirect	104	mmol/L	95 - 105

- * Useful in the diagnosis and treatment of dehydration, overhydration. Hypernatremia suggests dehydration and Hyponatremia (130 mmol/L) suggests overhydration.
- * Levels of sodium when evaluated with electrolytes aid in assessing acid base balance, water balance and water intoxication.
- * Useful in evaluation of electrolyte balance, cardiac arrhythmia, muscular weakness, hepatic encephalopathy and renal failure.
- * Ferritin is iron storage protein. Determination of ferritin is necessary in iron deficiency anemia, monitoring iron therapy and in differential diagnosis of anemia.

Ordered Location	: General Surgery/General Surgical Ward/GENERAL SURGICAL ROOM BED 49	Approved Date	: 24-Apr-2023 04:03 PM
		Specimen	: Serum

<u>PARAMETERS</u>	<u>METHOD</u>	<u>RESULT</u>	<u>UNIT</u>	<u>B.R.I</u>
HCV	Immune Chromatography	Non Reactive	N/A	NOT APPLICABLE

Interpretation :

Non Reactive : Presumed Not Infected With HCV Or Antibodies Not Yet Reached Detectable Levels.

Reactive : Indicates Acute Or Chronic Infection Or Chronic HCV Carrier State.

CLINICAL SIGNIFICANCE :

1. This Test Is For The Qualitative Detection Of Antibody To Hepatitis C Virus In Human Serum.
2. The Test Is Only a Screening Assay : It Should Always Be Used In Conjunction With Clinical History And Exposure risk for HCV infection.
3. A Non-Reactive screening result does not exclude the possibility of exposure to or infection with HCV.
4. The assay is neither useful in detecting immune response in acute/early HCV infection nor differentiate between past (resolved) and chronic Hepatitis C.
5. It is recommended to test further for HCV RNA detection and quantification by PCR, If clinically indicated or in persons who are at high risk for blood borne infections ,such as persons on Dialysis and frequent Blood Transfusions.

<u>PARAMETERS</u>	<u>METHOD</u>	<u>RESULT</u>	<u>UNIT</u>	<u>B.R.I</u>
HIV I & II	Immune chromatography	Non Reactive	N/A	NOT APPLICABLE

Interpretation : NONREACTIVE : Presumed Not Infected With HIV Or Antibodies Not Yet Reached Detectable Levels.

REACTIVE : Indicates Acute Or Chronic Infection Or Chronic HIV Carrier State.

Clinical Significance:

1. This Test Is For The Qualitative Detection Of Antibody To Human immune deficiency Virus (HIV) In Human Serum.
2. The Test Is Only a Screening Assay : It Should Always Be Used In Conjunction With other confirmatory test like PCR & Western blot.
3. A Non-Reactive screening result does not exclude the possibility of exposure to or infection with HIV.
4. The assay is neither useful in detecting immune response in acute / early HIV infection nor differentiate between past (resolved) and chronic Human immune deficiency virus.

		Specimen	: Serum

HBsAg (RAPID)

PARAMETERS	METHOD	RESULT	UNIT	B.R.I
HBsAg	Immune chromatography	Negative	N/A	NOT APPLICABLE

Interpretation :

Negative : Presumed Negative For Infection With Hepatitis B Virus.

Positive : Indicates Acute Or Chronic Hepatitis B Virus infection Infection Or Chronic HBV Carrier State.

CLINICAL SIGNIFICANCE :

1. This Test Is for The Qualitative Detection of Hepatitis B surface antigen (HBsAg) In Human Serum.
2. The Test Is Only a Screening Assay: The result should be confirmed by other methods like ELISA AND PCR.
3. Not Useful During Window Period Of Acute Hepatitis B infection (ie : after disappearance of hepatitis B surface antigen) and prior to appearance of hepatitis B surface antibody (anti HBS) testing for acute HBV infection.
4. Reactive Screening Results should be interpreted in conjunction with tests results of other HBV serological markers (Anti -HB Ab , Anti HBC Total , Anti HBc IgM , HBcAg, & Anti HBeAb).
5. Individuals who recently received Hepatitis B vaccination may have transient rise in the HBsAg levels and positive result for a transient period because of the high doses of HBsAg used in the vaccine.
6. Anomalous results may be observed in patients who are routinely exposed to animal or to animal serum products / received preparations of mouse monoclonal antibodies for diagnosis or therapy,
